AAT68369-T68381 and AAT70842 are a set of primers used in a method for assessing the integrity of a Y chromosome. The primers are capable of priming the chromosome loci: SMCY, DYS217, DYS220, DYS217, DYS237, DYS215, MIC2 and DAZ(6) and MIC2. The method can be used to rapidly and reproducibly assess the integrity of specific regions of the Y chromosome that are associated with male fertility. It can be used to assess the integrity of the Y chromosome in males exhibiting azosoparia or oligospermia (no or very little spermatozoa in the semen) or to assess the genotype of infants of phenotypically ambiguous sexuality. The method can also be used in diagnosis and quality control
                                                                                                                                                                                                                                                                                                                                                                                                                                    Assessing integrity of Y chromosome - by amplification of selected human chromosome loci by multiplex PCR and comparison with normal control DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       genetic disease; genetic trait; dog; carrier of recessive disease; copper toxicosis; CT; canine genome map; breed-specific profile; DNA fingerprint; dog identification; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0.8%; Score 14.2; DB 1; Length 20;

                                                                                                     This invention relates to novel oligonucleotide PCR primers which may be used to identify markers associated with genetic diseases and traits in obegs, in particular to disgnose genetic diseases that are not phenotypically visible and to identify carriers of recessive diseases. A specific application is diagnosis of copper toxicosis (CT). The invention can also be used to create a genetic map of the canine genome; to generate breed-specific profiles; to establish paternity and to identify dogs from DNA fingerprints. The method provides rapid analysis of the target sequences from only a small sample of DNA. Diagnosis can be done at any time in the dog's life. The present sequence is that of a PCR
New oligonucleotide primers for diagnosis of genetic diseases and traits in dogs - amplify specific regions of the genome containing microsatellite repeats, especially for diagnosing copper toxicosis and

```

This invention relates to novel oligonucleotide PCR primers which may be used to identify markers associated with genetic diseases and traits in dogs, in particular to diagnose genetic diseases that are not phenotypically visible and to identify carriers of recessive diseases. A specific application is diagnosis of copper toxicosis (CT). The invention

Claim 1; Page 15; 40pp; English.

carriers

New oligonucleotide primers for diagnosis of genetic diseases and traits in dogs - amplify specific regions of the genome containing microsatellite repeats, especially for diagnosing copper toxicosis and

The primers are designed based on the internal transcribed spacer (ITS) sequences of the various fungal species. The invention provides a DNA molecule isolated from the ribosomal RNA gene region of fungal pathogen, where the DNA molecule consists of an ITS sequence selected from ITS1 and ITS2 of Fusarium culmorum, Fusarium graminearum, Fusarium moniliforme, Septoria avenae or Microdochicum nivale. A method for detecting F graminearum, F. culmorum, F. moniliforme, F. poae, F. avenaceum and M. nivale isolates is also provided which comprises isolating DNA from a plant leaf infected with at least one of the above PCR using specific primers from within these sequences. The pathogen(s) by PCR using specific primers from within these sequences. The pathogen(s) by are detected by visualising the amplified part of the ITS sequence
can also be used to create a genetic map of the canine genome; to generate breed-specific profiles; to establish paternity and to identify dogs from DNA fingerprints. The method provides rapid analysis of the target sequences from only a small sample of DNA. Diagnosis can be done at any time in the dog's life. The present sequence is that of a PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Internal transcribed spacer; ITS; ribosomal RNA; Fusarium avenaceum; Fusarium culmorum; Pusarium graminearum; Fusarium moniliforme; plant; Septoria avenae; Microdochicum nivale; Fusarium poae; fungal pathogen; PCR; nucleic acid detection; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            various fungal isolates used for fungal detection in the course of the invention. The primers are designed based on the internal transcribed spacer (ITS) sequences of the various fungal species. The invention provides a DNA molecule isolated from the ribosomal RNA gene region of a fungal pathogen, where the DNA molecule consists of an ITS sequence selected from ITS1 and ITS2 of Fusarium culmorum, Fusarium graminearum, Fusarium moniliforme, Septoria avenae or Microdochicum nivale. A method for detecting F. graminearum, F. culmorum, F. moniliforme, F. poae, F. avenaeceum and M. nivale isolates is also provided which comprises insolating DNA from a plant leaf infected with at least one of the above pathogens and amplifying parts of the ITS sequence of the pathogen(s) by PCR using specific primers from within these sequences. The pathogen(s) are detected by visualising the amplified part of the ITS sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Internal transcribed spacer; ITS; ribosomal RNA; Fusarium avenaceum; Pusarium culmovum; Fusarium graminearum; Fusarium moniliforme; plant; Septoria avenae; Microdochicum nivale; Fusarium poae; fungal pathogen; PCR; nucleic acid detection; PCR primer; ss.

Primer pairs, based on the ITS sequences, are used for the PCR amplification detection of wheat Microdochium and Fusarium fungal pathogens, especially M. nivale, F. graminearum, F. culmorum, F. avenaceum, F. pose, F. moniliforme or F. roseum. The two different strains of fungi show different symptoms during infection, which may or may not be due to infection. Barly identification of the strain causing the infection allows early, and more specific fungicidal treatment. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                       Internal transcribed spacer; ITS; Microdochium; Fusarium; wheat pathogen; fungal pathogen identification; infection identification; PCR primer; ss.

PCR primers AAV43271-76 were used to isolate internal transcribed spacer (ITS) regions from Helminthosporium turcicum isolates 6586, 26306 and 6402, H. maydis isolates 6921, 11554 and 24772, H. carbonum isolates 5870 and 16185, Kabbtiella zeae isolates 5631, 18594 and 5125 and Cercospora zeae-maydis isolates 5860, POPS 12 and Ladder 3-1. The specification describes a method for the detection of a maize fungal pathogen. The method comprises isolating DNA from a plant leaf infected with a pathogen, subjecting the DNA to PCR amplification using at least one primer derived from the ITS sequence (see AAV43277-303)
                                                                                                                                     PCR primers AAV43271-76 were used to isolate internal transcribed spacer (ITS) regions from Helminthosporium turcicum isolates 6586, 26306 and 6402, H. maydis isolates 6921, 11534 and 24772, H. carbonum isolates 5870 and 16185, Kabatiella zeae isolates 5631, 1854 and 5125 and Cercospora zeae-maydis isolates 5860, POPS 12 and Ladder 3-1. The specification describes a method for the detection of a maize fungal pathogen. The method comprises isolating DNA from a plant leaf infected with a pathogen, subjecting the DNA from a plant leaf infected with a primer derived from the ITS sequence (see AAV43277-303)
               New internal transcribed spacer sequences of maize fungal pathogens and primers and primer pairs – used to detect pathogens e.g. Helminthosporium carbonum, Cercospora zeae-maydis and Kabatiella zeae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New internal transcribed spacer sequences of maize fungal pathogens and primers and primer pairs - used to detect pathogens e.g. Helminthosporium carbonum, Cercospora zeae-maydis and Kabatiella zeae.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           а
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a primer based on an internal transcribed spacer (ITS) sequence of the invention. Primer pairs, based on the ITS sequences, are used for the PCR amplification detection of wheat Microdocchium and Fusarium fungal pathogens, especially M. nivale, F. graminearum, F. culmorum, F. avenaceum, F. poae, F. moniliforme or F. roseum. The two different strains of fungi show different symptoms during infection, which may or may not be due to infection. Barly identification of the strain causing the infection allows early, and more specific fungicidal treatment. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This PCR primer anneals to bases 371-390 of a human lipid metabolic pathway h-LMP-1 cDNA clone (see AAV11548) isolated from human breast cDNA. It can be used in PCR reactions to clone LMP homologues in other cell types, e.g. from other tissues and from other mammalian organisms. LMP nucleic acids and polypeptides (see AAM58888) are useful for developing methods for treatment of cardiovascular diseases or for modulating lipid uptake or metabolism, and in drug screening assays
                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA encoding lipid metabolic pathway polypeptide(s) - useful for treatment of cardiovascular disease or modulation of lipid uptake or

Genomic DNA, or blood, from a subject is combined with several distinct oligonucleotide primer pairs capable of simultaneously priming several human Y chromosome loci which are linked to normal fertility in human males. The present primer pair (AAV42502-03) amplify loci DYS7. The primer pairs are amplified by multiplex PCR, yielding amplified chromosomal DNA fragments which are isolated and compared with those from normal male subjects. The method is useful to detect deletion multations on a Y chromosome which are predictive of human male
                                                          Assay; Y chromosome; Y chromosome loci, human, male fertility, detection, deletion mutation, male infertility; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                              Assessing Y chromosome integrity in predicting human male infertility by amplifying specific regions of human Y chromosome linked to normal fertility by multiplex PCR and detecting deletion mutations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                      pCR primers AAV22642-46 are specific for Phytophthora species which infect potatoes and cause diseases such as late-blight. PCR primers AAV2264-43 amplify a 456 bp fragment from P. infestens. PCR primers AAV22644-45 amplify a 136 bp fragment from P. erythroseptica, and PCR primers AAV22643 and AAV22646 amplify a 455 bp fragment from P. incotianae. The primer sets are useful for detecting Phytophthora species by PCR. Phytophthora species infecting potatoes may result in late blight (caused by P. infestens) or in pink rot (caused by P. erythroseptica and P. bricotianae), and the primers can detect these diseases and

specifically hybridisable with a region of a nucleic acid encoding rat comportant. The present invention also describes antisense of the corporation of the corporation. The present invention also describes antisense oligonucleotides which regulate the co-un protein. The antisense oligonucleotides are used for the diagnosis and treatment of diseases or disorders associated with Activating Protein 1 expression, of which corporates associated with the antisense oligonucleotides are used in compositions as corporated with a carrier and a chemotherapeutic agent. They are used to regulate the expression of co-pos or co-un in calls or tissues, preferably by inhibiting metastasis. They also regulate cell cycle expression and can be used to treat an animal with, or being prone to, a
                                                                                                                                                                                                      0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antisense oligomucleotides regulating Activating Protein 1 subunits - hybridise with c-fos and c-jun mRNA, used for regulating metastasis, cell cycle expression and hyperproliferative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Rat; c-fos; c-jun; activating protein 1; AP-1; diagnosis; metastasis; antisense oligonucleotide; phosphorothioate; regulation; malignant tumour; cell cycle expression; hyperproliferative disease; ss.
anaemia of complementation group A (FA-A) protein of the invention. The amplified DNA's may be used to complement a genetic defect in a cell (especially the FA-A gene). The products can be used for screening (especially prenatal FA-A), detection of FA-A carriers and FA-A disease
                                                                                                                                                                                                      Gaps

This sequence represents a primer for Candida nucleic acid sequences. T amplified sequences are recognised by the probes of the invention. The probes can be used in the method of the invention for the detection of Aspergillus sp. and Candida sp. in a sample. The probes can be used to diagnose systemic candidiasis. (Updated on 27-AUG-2003 to correct OS field.)

The amplified sequences are recognised by the probes of the invention. The probes can be used in the method of the invention for the detection of Aspergillus sp. and Candida sp. in a sample. The probes can be used to diagnose systemic candidiasis. (Updated on 27-AUG-2003 to correct OS field.)

PCR primers AAT89973-T89976 and AAT89982 are used to amplify the ITS2 region of Candida albicans. This amplified region is used in a novel method for diagnosing systemic candidiasis and comprises hybridising DNA released from lysed Candida cells in a blood sample with a probe specific for the ITS2 region. Probes derived from this region can be used for krusei, C. parapsilosis or C. albicans in immunocomparis, C. glabrata, C. candida cell per microlitre of blood can be detected
                                                                                               PCR primers AAT89973-T89976 and AAT89982 are used to amplify the ITS2 region of Candida albicans. Primer AAT89974 is approximately 25bp from the end of the 5.8S subunit. This amplified region is used in a novel method for diagnosing systemic candidiasis and comprises hybridising DNA released from lysed Candida cells in a blood sample with a probe specific for the ITS2 region. Probes derived from this region can be used for detecting pathogenic candida spp. such as C. tropicalis, C. glabrata, C. krusei, C. parapsilosis or C. albicans in immunocompromised hosts. One Candida cell per microlitre of blood can be detected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Diagnosis of systemic candidiasis by hybridisation assay - using probes specific for new or known Candida DNA sequences.
           Diagnosis of systemic candidiasis by hybridisation assay - using probes specific for new or known Candida DNA sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ITS2 rDNA; systemic candidiasis; pathogen; diagnosis; PCR primer; ss.

Optionally the oligonucleotide include at least one 2'-(2-methoxyethoxy) sugar modification or phosphorothicate internucleotide linkages. The oligonucleotides (AAX17861 -X17924) are also used to inhibit CWV infections (by in vivo or in vitro contact with cells, tissues or body fluids), especially to treat or prevent CWV infections, particularly retinitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense oligonuclectides that target cytomegalovirus nucleic acid particularly including 2-methoxyethoxy sugar modifications, especially for treating viral retinitis, with long-lasting retention in the retina.

                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense oligonucleotides (AAX17861-X17924) are targeted to a nucleic acid (AAX17925-X17948) encoding IE (immediate early) 1 or 2, or DNA polymerase of cytomegalovirus (CWV) and are able to inhibit CWV replication. Optionally the oligonucleotides include at least one 2'-(2-methoxyethoxy) sugar modification or phosphorothioate internucleotide linkages. The oligonucleotides are used to inhibit CWV infections (by in vivo or in vitro contact with cells, tissues or body fluids), especially to treat or prevent CWV infections, particularly retinitis
                                                                                                                                                                                                                                                                                                                                                                             New antisense oligonucleotides that target cytomegalovirus nucleic acid particularly including 2-methoxyethoxy sugar modifications, especially for treating viral retinitis, with long-lasting retention in the retina.

cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for detecting a selected genetic defect in a individual, e.g. a fetus. They can also be used for determining the effect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction correct family. Sequences AAZI7803-Z13432 repersent primers that can be used the RT-PCR reactions to determine the pattern of gene expression. The

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell the pattern cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its constitute, whether it carries a genetic defect, or whether it is transformed. They can be used for determining the confidence of they can be used for determining the confining cells capable of expressing an homeobox related desired containing cells capable of expressing an homeobox related desired containing cells capable of expressing an homeobox related desired containing cells capable of expressing an homeobox related desired containing the pattern of gene expression in a selected contained containing the pattern of gene expression in a selected contained containing the pattern of gene expression in a selected contained from a selected from a set of homeobox genes, kinase genes, containing cells capable of expression and selected containing cells capable of containing the pattern of gene expression. The containing cells capable of containing cells capable contained the pattern of gene expression. The containing cells capable contained from a set of homeobox genes, kinase genes, containing cells capable containing cells capable contained containing cells capable containing cells capable containing cells capable cells capable containing cells capable cells ca
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Genetic proximity, gene expression; cell characterisation; homeobox gene; genetic defect; reverse transcriptase polymerase chain reaction; RT-PCR; kinase gene; protein phosphatase; P450; steroid receptor; cadherin;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying and characterizing cells by comparing the pattern of gene expression in a selected gene family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0.8%; Score 14.2; DB 1; Length 20; 44.2%; Pred. No. 8.7e+02;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 calls. The above can exeminate the genetic proximity of a first cell
and a second cell comprises: (a) obtaining the first cell and the second
cell; (b) determining in the first cell and the second
cell; (b) determining in the first cell and the second
cell; (b) determining in the first cell and the second
cell; (b) determining in the first cell and the second
cell; (c) determining the proximity; and (c) calculating a
consimity index using a specified formula. The methods can be used for
characterising cells, e.g. for determining the origin of a cell, its
considered. They can be used for detecting a selected genetic defect in
con individual, e.g. a fetus. They can also be used for detecting a selected treatment on a test cell. They can also be used for
containing cells capable of expressing an homeobox related desired
containing cells capable of expressing an homeobox related desired
containing cells capable of expressing an homeobox related desired
containing cells capable of expressing an homeobox related desired
containing cells capable of expressing an homeobox related desired
containing cells capable of expressing an homeobox gene spainty can be used
containing thosphatuses partern of gene expression in a selected
containing cells capable of capable of capacity represent primers that can be used
containing thosphatuse genes, steroid receptor
containing cells capable of capacity of ca
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Genetic proximity, gene expression, cell characterisation, homeobox gene, genetic defect, reverse transcriptase polymerase chain reaction, RT-PCR, kinase gene, protein phosphatase, P450, steroid receptor, cadherin,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention provides a new method for identifying and characterising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying and characterizing cells by comparing the pattern of gene expression in a selected gene family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                           cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell; its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for detecting a selected genetic defect in a individual, e.g. a fetus. They can also be used for determining the effect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired containing the property. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AAA17803-Z18942 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Genetic proximity, gene expression, cell characterisation, homeobox gene; genetic defect, reverse transcriptase polymerase chain reaction, RT-PCR, kinase gene; protein phosphatase; P450; steroid receptor, cadherin;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       kinase genes,
                                                                                                                                                                                                                                                                                                                                                                                             The invention provides a new method for identifying and characterising
                                                                                                                                                                                                                                                                                                   Identifying and characterizing cells by comparing the pattern of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the first cell and the second cell; (b) determining in the second cell; (c) calculating a comparity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its cansformed. They can be used for detecting a selected genetic defect in a individual, e.g. a fetus. They can also be used for determining the effect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction property. The method uses reverse transcriptase polymerase chain reaction cylls for determining the pattern of gene expression in a selected cyll in the RT-PCR reactions to determine the pattern of gene expression. The gene family, can be selected from a set of homeobox genes, kinase genes, parcel and the pattern of gene expression. The property is the contract of the pattern of the contract of the contrac
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Internal transcribed spacer 2; ITS2; probe; Aspergillus flavus; A. niger; A. terreus; A. nidulans; Rusarium solani; F. moniliforme; Mucor rouxii; M. racemosus; M. plumbeus; M. indicus; A. fumigatus; M. microsus; M. oricinilloides f. circinelloides; Rhizopus oryzae; R. microsporus; K. circinelloides; Rhizomucor pusillus; Absidia corymbifers; Cunninghamella elegans; Pseudallesheria boydii; Scedosporium apiospermum; Penicillium notatum; Sporothrix schenkii; filamentous fungus; PCR primer;

                                                                                                                                                             à
                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                         PCR primers AAV70875-76 and AAV83709 were used to amplify internal transcribed spacer 2 (ITS2) and adjacent regions of various filamentous tungi. Probes can be derived from the amplified sequence (see AAV70845-73) which are species-specific, and can be used for identifying a species selected from Aspergillus flavus, A. fumigatus, A. niger, A. terreus, A. nidulans, Pusarium solani, F. moniliforme, Mucor rouxii, M. racemosus, M. plumbous, M. indicus, M. circinilloides f. circinelloides finizopus oryzae, R. microsporus, R. circinals, R. stolonifer, Rhizomucor pusillus, Absidia corymbifera, Cunninghamella elegans, Pseudallesheria boydii (teleomorph of Scedosporium apiospermum), Penicillium notatum, or Sporothrix schenkii. The probes can be used for differentiating filamentous fungal species from each other and from other medically
                                                                                                                   New nucleic acid probes for filamentous fungi - for detecting e.g. Aspergillus, Fusarium, Mucor, Rhizopus, Rhizomucor, Absidia, Cunninghamella, Pseudoallescheria boydii, Penicillium and Sporothrix

These ORFs encode polypeptides (see AAX36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and riboxyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachom, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, penital diseases such as nongonococcal uretritis, penital sistem applymitis, carvicitis, antipnightis, partholinitis, penumopathy in breast feeding infants, and venereal lymphogramulomatosis. The polypeptides of the invention may be of use in treating these
                                                                                                                        The present sequence represents a PCR primer used to amplify nucleic acid encoding a cat protein having thrombopoietin activity. The protein promotes the growth and the growth differentiation of megakaryocytes. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; PCR primer; bartholinitis; pneumopathy; venereal lymphogranulomatosis; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Vaccine, eye disease, conventional trachoma, nonendemic trachoma, paratrachoma, inclusion conjunctivitis, genital disease, perihepatitis, nongonococcal uretritis, epidymitis, cervicitis, salpingitis, PCR primer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PCR primers AA201426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAX36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis, pneumopathy in breast feeding infants; and venereal lymphogranulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The polypeptides of the invention may be of use in treating these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0.8%; Score 14.2; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAX36734-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, peneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

This primer was used to amplify a region of the 5.85 rRNA, the Internal Transcribed Spacer or ITS sequence. This region is highly conserved between species. The Internal Transcribed Spacer (ITS) sequences can be isolated from the ribosomal RNA gene region of fungal pathogens, such as Pyrenophora tritici-repentis. The ITS can then be probed for by a sequence with at least 10 contiguous mucleotides in homology with the ITS. This provides a method four detecting fungal pathogens of crops, such as wheat and maize, the sensitivity of this method allows differentiation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This primer was used to amplify a region of the 5.8S rRNA, the Internal Transcribed Spacer or ITS sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PCR primers AAZ01426-206209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAX36754-X37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and inbozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis, pneumopathy in breast feeding infants; and venereal lymphogranulomatosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence is a PCR primer used with primer tpric (AAX89550) to amplify genomic DNA from a human chromosome 5 deletion panel. The primer is based on positions 810 to 829 of the 3' untranslated region of tpri (AAX89545). The amplified fragment of tpri is used in the construction of plasmid vectors. tpri and tpr2 are novel terratricopeptide repeat (TPR)-containing genes. It has been suggested that the product of the tpri gene (AAX29466) and tpr2 gene (AAY29467) may be targeted to an abnormality of protein folding. Although the genes tpri and tpr2 both encode TPR elements they are otherwise unrelated
ITS. This provides a method for detecting fungal pathogens of crops, such as wheat and maize, the sensitivity of this method allows differentiation

This invention describes a novel composition comprising a number of sensor arrays, where each array comprises a unique probe oligonucleotide, which is the reverse complement of part of a unique trarget of the reverse complement of part of a unique trarget of included the compositions form a method for characterizing a sample of target deletion oligonucleotides with the probe oligonucleotides of the sensor arrays. Such oligonucleotides and their targets are represented in AAX3548-X23709. Oligonucleotides characterized by the method form pharmaceutical compositions that are useful for modulating cellular adhesion or proliferation, and being active against a eukaryotic pathogen, a human immunodeficiency virus (HIV), or a non-human retrovirus, including influenza virus, Epstein-Barr virus, Respiratory Syncytial Virus or cytomegalovirus (GWV). The compositions enable characterization of deletion sequence oligonucleotides having related, but different nucleobase sequences, and quantification of different species of deletion sequence ("trarget") oligonucleotides in a mixture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Also, if the specificity of the oligonucleotide's nucleobase sequence for its reverse complement is not modified, the method may be performed using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New compositions comprising sensor arrays made up of unique probe oligonucleotides - useful for characterizing a sample of target deletion oligonucleotides.

C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyagitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX34584- AAX35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions,

NAME OF COLOR OF STREET OF

```
This sequence is a primer for a Candida internal transcribed spacer region 2 (ITS2) sequence. The invention relates to a nucleic acid probe for a Candida species that selectively hybridises with a nucleic acid molecule encoding a portion of the ITS2, or a complementary sequence of Candida species selected from Candida guilliermondii, C. haemulonii, C. kefyr, C. lambica, C. lusitaniae, C. norvegensis, C. norvegica, C. rugosa, C. utilis, C. vismanathii, C. zeylanoides, C. dubliniensis, and C. pelliculosa. The nucleic probes can be used to detect, identify and distinguish or differentiate between Candida species in a sample or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        specimen with high sensitivity and specificity. The probes can be used to detect the presence of Candida in the sample, diagnose infection with the disease, quantify the amount of Candida in the sample, or monitor the progress of therapies used to treat the infection. They can also be used to study the organisms and related diseases and to guide therapies and treatments for the diseases
                                                                                                                                                                                                                                                                                                                       New nucleic acid probes for Candida species - comprises a sequence which hybridises with a nucleic acid molecule encoding a portion of the

pCR primers AAZ22885-Z22586 are used to amplify the internal transcribed spacer region (ITS1) of the nuclear small subunit (mss) of Neospora caninum isolates (CNH and BPAR1-AAZ2284). The invention relates to a biologically pure culture of equine Neospora, and the PCR product is used in the identification of the culture. Immunogens (optionally expressed in the identification of the culture. Immunogens (optionally expressed in the identification of Neospora are used in vaccines for the treatment or prevention of Neospora are used in vaccines for animals. Neospora is a causative agent of equine protozoal myeloencephalitis (EPM). Detection of Neospora specific antigens, antibodies or nucleic acid (by usual immunosasy or hybridization tests) is used to diagnose infection. Antibodies specific for equine Neospora are used for diagnose infection. Antibodies specific for equine Neospora are used for diagnose infection. Antibodies specific for equine Neospora allow differentiation between equine protozoal myeloencephalitis caused to by Neospora and Sarcocystis neurona. These pathogens require different treatments and treatment of Neospora is only effective if applied before the parasite has formed cysts. The vaccines also prevent shedding of cocysts by animals known to be infected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

modulate the expression of Jun N-terminal kinase (JNK) proteins. The oligonucleotides specifically hybridize to a nucleic acid encoding a JNK1, JNK2 or JNK3 protein, and which modulate expression of these proteins. The oligonucleotides are useful for modulating JNK protein expression and cell cycle progression in cultured cells or animal cells. The oligonucleotides are also useful for modulating the phosphorylation of a protein that has been phosphorylated by a JNK protein, and the expression of a cellular protein that promotes one or more metastatic events. The oligonucleotides also form pharmaceutical compositions for treating animals with a hyperproliferative disease, and for inhibiting tumor growth in an animal. The invention also provides sequences that caspecifically hybridise to nucleic acids encoding rat stress activated protein kinase (SAP) or p54, a homologue of human JNK protein

invention relates to antisense oligonucleotides that detect and

```
New antisense compounds targeting nucleic acids encoding human PI3 kinase pI10 delta useful for treating a disease or condition associated with PI3 kinase pI10 delta expression, e.g. rheumatoid arthritis, asthma.
                                                                                                                                                                                                                                                                                                               /mod_base= OTHER

human origin. The collectin can be used as an antibacterial and antiviral agent and for screening potential drug molecules. The new collectin can be produced by standard recombinant methodology. Sequences AAA07708-11 represents PCR primers for cap site sequencing of human collectin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is that of the forward primer used in the real-time quantitative PCR amplification of cancer specific gene Pro115 (see AAZ95004 and AAZ95005). Overexpression of Pro115 was found in 3 of 4 primary prostate cancer samples examined, indicative of it being a diagnostic marker for prostate cancer. The invention provides ESTs and tall-length contigs for cSGs (see AAZ94998-295017). The CSGs, polypeptides encoded by them, and antibodies that specifically bind CSG are used in claimed methods for detecting, diagnosing, monitoring,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Diagnosing, staging and monitoring the presence and metastases of prostate cancer especially useful for treating prostate cancer comprises measuring changes in cancer specific gene levels.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          엄
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         à
                                              This sequence represents a phosphatidyl inositol 3 kinase (PI3K)
targeting antisense oligonucleotide. Phosphatidyl inositol 3 kinases act
as downstream effectors of hormone and growth factor receptors, and have
been implicated in growth factor mediated cell transformation, and
mitogenesis, protein trafficking, cell survival and proliferation, and
mitogenesis, protein trafficking, cell survival and proliferation, and
cell many other cellular activities. PI3K is a heterodimer, consisting of a
llokb catalytic subunit (pilo), and an 85kD regulatory subunit (p85). The
invention relates to antisense oligonuclectides which target the pilo
cell many of PI3K. The antisense oligonuclectides may be used to treat
with various regions of the PI3K mRNA sequence, and inhibit the
cexpression of PI3K. The antisense oligonuclectides may be used to treat
an animal, particularly human, suspected of having or being prone to a
disease or condition associated with the expression of PI3K. The
modulation (preferably inhibition) of the expression of PI3K. The
modulation (preferably inhibition) of the expression of PI3K. The
confidence associated with compositions and formulations, in the preparation of
this for detecting the level of PI3K in a sample, and as prophylaxis,
cell to prevent or delay infection, inflammation or tumour formation.
Cell confidence and to elucidate the function of particular genes, and
confidence the functions of various members of a biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .

monoclonal antibodies directed against TAG-72, designated colon cancer (CC) antibodies. The Cantibodies are produced from the rearrangement of WilaphaTAG (AAZ40711). The antibodies are produced from the rearrangement of WilaphaTAG (AAZ40701). The antibodies are used in the invention which relates to a new anti-tumour associated sialylated glycoprotein antigen (TAG)-72 mouse-human chimeric antibody. The variable region of the antibody has a heavy chain (VM) where VM is encoded by a DNA sequence contibody has a heavy carcinoma targeting through the administration to an animal of an anti-TAG-72 mouse-human chimeric antibody produced by specific cell lines. The antibody or a fragment are conjugated to an imaging marker or therapeutic agent, in a pharmaceutically acceptable, contoxic, sterile carrier. The chimeric antibody binds to TAG-72 which is found on certain human tumour cells. The tissue regions containing the therapeutic agents. The method is useful for in vivo diagnosis and the therapeutic agents. The method is useful for in vivo diagnosis and treatment of cancer by administering to an animal an effective amount of a composition for the in situ detection of carcinoma lesions. The method is useful for intraoperative therapy, consisting of locating the position of a tumour thumour through the administration of the antibody, followed by

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nuclectide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies the human genome and in complex association studies and haplotyping studies. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents acting methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and researt invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .

The present invention describes an antibody (I) produced by one of the following cell lines: CH44-1 (ATCC HB9884); CH44-2 (ATCC HB9881); CH44-4 (ATCC HB9877); CH88-1 (ATCC HB9881); CH88-3 (ATCC HB9877); CH88-4 (ATCC HB9878); CH88-5 (ATCC HB9878); CH84-2 (ATCC HB9878); CH84-2 (ATCC HB9878); CH84-3 (ATCC HB9878); CH84-4 (ATCC HB9875), capable of binding to tummour-associated sialylated glycoprotein (TAG)-72 with an affainity at least 25% greater than B72.3. (I) can be used for treating and diagnosing cancer, and for the in situ detection of carcinoma lesions and for in vivo therapy. AAA29682 to AAA29744, and AAY90714 to AAY90723, represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel family of chimeric antibodies for treating cancer with high affinities to a high molecular weight tumor-associated sialylated glycoprotein antigen of human origin.

The invention relates to a gene (AAA72051) from Japanese citrus viroid 2 (JCVd2, citrus viroid-I-LSS). The invention also encompasses the CDNA (AAA72052) of this gene, variants of the gene, primers (AAA72053-A72054) and probes specific for the gene, and a method for the detection of the gene. The JCVd2 RNA was isolated from the leaves and bark of infected citrus medica trees. Probes of the invention may be used to detect infection by JCVd2, and therefore may be used to provide viroid free citrus seedlings. Sequences AAA72053-A72057 represent reverse transcription PCR (RI-PCR) primers for the amplification of the JCVd2 gene or it, fragments. Sequences AAA72055 and AAA72056 constitute a
                                                                                                                                                                                                                                                                                                                                                                                                                                                        0.8%; Score 14.2; DB 1; Length 20;

Novel methods for reducing apoptosis comprising contacting cells with antisense oligonuclectides, useful for treating apoptotic disorders, e.g. cancer

Example 8; Page 150; 160pp; English.

The present invention relates to antisense oligonucleotides (AAC62844-C63000, AAA66093-A96099 and AAA07993) that hybridise specifically to a nucleotide encoding a Jun N-terminal kinase (JNK2) protein, resulting in decrease of JNK2 expression and leading to induction of apoptosis. The present sequence is one such antisense oligonucleotide. The oligonucleotides of the present invention are useful for treating diseases or conditions with reduced apoptosis, e.g. cancer and cellular hyperproliferation. The oligonucleotides may also be used to increase the stimulation of apoptotic proteins, e.g. for treating Alzheimer's or

ö The present sequence is a PCR primer which can be used for fungal pathogen detection especially Monilinia laxa or M. fructicola. This sequence may be used to amplify DNA isolated from a plant leaf infected with a pathogen via PCR. The resulting PCR product may then be detected via standard methods. Use of the present sequence for detecting fungal pathogens provides a detailed information on the developments and spread of specific pathogen races over extended geographical areas and further provides a method of detection especially suitable for diseases with a long latent phase. The present sequence is derived from fungal Internal Transcribed spacer (ITS) sequence of the ribosomal RNA gene 5.8S Use of an oligonucleotide primer for identification of a fungal pathogen especially Monilinia laxa or M. fructicola, comprises a nucleotide Gaps . 0 0.8%; Score 14.2; DB 1; Length 20; 14.2%; Pred. The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovacular, endocrine and neurological systems, such as coronary artery disease, echizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Single nucleotide polymorphism; SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is a PCR primer which can be used for fungal pathogen detection especially Monilinia laxa or M. fructicola. This sequence may be used to amplify DNA isolated from a plant leaf infected with a pathogen via PCR. The resulting PCR product may then be detected via standard methods. Use of the present sequence for detecting fungal pathogens provides a detailed information on the developments and spread of specific pathogen races over extended geographical areas and further provides a method of detection especially suitable for diseases with a long latent phase. The present sequence is derived from fungal Internal Transcribed spacer (ITS) sequence of the ribosomal RNA gene 5.8S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Single nucleotide polymorphism; SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Use of an oligonucleotide primer for identification of a fungal pathogen especially Monilinia laxa or M. fructicola, comprises a nucleotide sequence having defined base pairs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular,

The present invention is concerned with a number of human single

Lander

```
The present invention relates to a method for obtaining adult mammalian central nervous system (CNS) derived progenitor cells or adult mammalian CNS-derived stem cells from a cell population containing adult mammalian CNS tissue. The method involves subjecting dissociated mammalian CNS tissue to 1 or more buoyancy-based separation systems. The cells may be used to repair damaged or diseased tissue in mature mammals, particularly neuronal tissue such as retinas. In particular, the method may be used for repopulating a retina of a dystrophic animal with neurons by injecting CNS cells from a healthy donor. The present sequence is a primer used to amplify rat trkB RNA. This was used to assay the responsiveness of CNS stem cells when exposed to retinoic acid and a
nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Producing adult mammalian central nervous system (CNS)-derived progenitor cells or adult mammalian CNS-derived stem cells from adult mammalian CNS tissue for the treatment of opthalmic disorders.
                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Primer; central nervous system; CNS; buoyancy-based separation; rat;

The invention concerns chimaeric antibody heavy chains or their chimaeric antibody leave the ability to combine with anti-TAG-72 antibody light chain to form a binding site having an affinity for TAG-72 which is at least 25% greater than that of B72.3 (an antibody known to the prior art). TAG-72 is a human tumour antigen thought to be a mucin glycoprotein. DNA sequences encoding the chimaeric heavy chains are useful for producing antibodies that are useful for cancer treatment, such as in vivo diagnostic assays, in vivo therapy and radioiammunoguided surgery. The antibodies produce significantly fewer side-effects when administered to human patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel DNA sequence encoding chimeric antibody heavy chain or its chimeric antigen-binding fragment, useful for cancer treatment, such as in vivo diagnostic assays, in vivo therapy and radioimmunoguided surgery.

                                                                                                                                                                                                                        The present invention relates to a method for preparing phosphorothioate oligonucleotides having at least one nucleoside with a 2' modification. The method comprises phosphitylating the 5'-hydroxyl of a nucleic acid group having at least one nucleoside with a 2' modification in an acetonitrile. The present sequence was used to illustrate the method of the present invention. The method is useful for synthesising sulphurised 2' substituted phosphorothioate oligonucleotides, which may be used in molecular biological research, in applications such as anti-viral therapy, and for determining the stereochemical pathways of certain
Preparing sulfurized 2' substituted phosphorothicate oligonuclectides useful in biological research, comprises phosphitylating the 5'-hydroxyl of a nucleic acid having a nucleoside with a 2' modification.

The present invention describes a method for differentiating between seeds of Cyamopsis tetragonoloba (guar) and Ceratonia siliqua (locust bean) from differences in rDNA extracted from them. The seeds are germinated, DNA extracted and amplified by polymerase chain reaction (PCR) using transcribed spacer) region) and TR3/TR3 (flanking the ITS intervening transcribed spacer) region) and TR3/TR3 (flanking the ITS cagion). The amplicons are then detected. Also described are: (1) the detection of guar gum, individually or mixed with locust bean gum, by corresponding to guar; and (2) extraction of DNA, amplification by PCR and detecting amplicons corresponding to guar; and (2) extraction of DNA from guar gum and/or locust bean gum. The method is used to differentiate between guar and clocust bean seeds (or their derived gums), e.g. to confirm authenticity of guar gum. The gums are used as thickners, gelling agents and stabilisers in foods. The specified primers provide selective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Internal transcribed spacer; ITS; PCR primer; 5.8s rDNA; fungal pathogen;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     EXEXEXEX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method for differentiating between seeds of Cyamopsis tetragonoloba (guar) and Ceratonia siliqua (locust bean) from differences in TDNA extracted from them. The seeds are germinated, DNA extracted and amplified by polymerase chain reaction (PCR) using the rDNA-specific primer pairs ITS5/ITS2 (flanking the ITS2 (intervening transcribed spacer) I region) and ITS3/ITS4 (flanking the ITS2 (intervening transcribed spacer) I region) and ITS3/ITS4 (flanking the ITS2 caregion). The amplicons are then detected. Also described are: (1) the detection of guar gum, individually or mixed with locust bean gum, by extraction of DNA, amplification by PCR and detecting amplicons corresponding to guar; and (2) extraction of DNA from guar gum and/or locust bean gum. The method is used to differentiate between guar and locust bean seeds (or their derived gums), e.g. to confirm authenticity of guar gum. The gums are used as thickeners, gelling agents and stabilisers in foods. The specified primers provide selective identification of the different seeds. The present sequence represents the ITSS PCR primer from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Differentiating between guar and locust bean seeds, or derived gums, by amplifying specific, characteristic regions of ribosomal DNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        geographical areas. The DNA sequences are specifically used as primers in PCR-based analysis for the identification of fungal pathotypes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Internal transcribed spacer; ITS; PCR primer; 5.8s rDNA; fungal pathogen; wheat disease; Sharp eyespot; fungal pathotype identification; ss; ITS3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence is a PCR primer used to amplify the internal transcribed spacer (ITS) from the 5.8s rDNA gene of wheat fungal pathogens. The ITS DNA sequences are useful for detecting Rhizoctonia cerealis, a fungal pathogen of wheat causing Sharp eyespot, for monitoring disease development in plant population, and for providing detailed information on the development and spread of specific pathogen races over extended in the population and spread of specific pathogen races over extended in the part of the pathogen races over extended in the part of the pathogen races over extended in the part of the pathogen races over extended in the part of the pathogen races over extended in the part of the pathogen races over extended in the part of the pathogen races over extended in the part of the pathogen races over extended in the pathogen races over extend

The ITS DNA sequences are useful for detecting Rhizoctonia cerealis, a fungal pathogen of wheat causing Sharp eyegot, for monitoring disease development in plant population, and for providing detailed information on the development and spread of specific pathogen races over extended geographical areas. The DNA sequences are specifically used as primers in PCR-based analysis for the identification of fungal pathotypes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to detecting and identifying fungal pathogenic species in a sample. The method involves hybridizing a nucleic acid of a fungal pathogen possibly present in the sample with at least one oligonucleotide probe, from an Internal Transcribed Spacer (ITS) region. The method is useful for simultaneous detection and differentiation of clinically important fungi in a single assay, particularly Candida albicans, C. parapsilosis, C. tropicalis, C. kefyr, C. krusei, C. glabratea, C. dubliniensis, Aspergillus flavus, A. versicole, A. nidulans, A. fumigatus, C. neoformans and pneumocystis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detecting and identifying fungal pathogens, especially Candida, cryptococcus and Aspergillus, comprises hybridizing the amplified nucleic acid of the fungal pathogen with a probe from the internal transcribed spacer region of a DNA.
New internal transcribed spacer DNA sequences, useful for identifying fungal pathogen, particularly Rhizoctonia cerealis, and for monitoring disease development in plant population.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Σ̈́

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to detecting and identifying fungal pathogenic species in a sample. The method involves hybridizing a nucleic acid of a fungal pathogen possibly present in the sample with at least one oligonucleotide probe, from an Internal Transcribed Spacer (ITS) region. The method is useful for simultaneous detection and differentiation of clinically important fungi in a single assay, barticularly Candida albicans, C. parapsilosis, C. tropicalis, C. kefyr, C. krusei, C. glabrata, C. dubliniensis, Aspergillus flavus, A. versicole, A. nidulans, A. fungatus, C. neoformans and pneumocystis carinii. The method is especially useful in the detection of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             such

The invention relates to a method for the detection of an abnormal allele

of the human interferon regulatory factor-1 (IRF-1) gene. The abnormal

allele (AAH46293) is present in PLC/PRF/5 liver cancer cells and contains

a fo A substitution at position 196 of the IRF-1 promoter region

c formal alleles given in AAH46293 and AAH46294). The abnormal allele

confers an insensitivity to the effects of interferon (IFW). In the

confers an insensitivity to the effects of interferon (IFW). In the

confers an insensitivity to the effects of interferon is at position

confers an insensitivity to the effects of interferon is to option

confers an insensitivity to the effects of interferon is to option

confers an insensitivity to the effects of interferon is to optionally be prepared (e.g., by PCR). The invention also discloses the

cuse of IRF-1 gene fragments as probes to detect the A polymorphism. The

method of the invention is used to genotype a patient with hepatitis C

curron (HCV) infection in order to predict whether interferon therapy will

confers the invention of the invention to amplify wild-type and polymorphic

confers an exemplification of the invention to amplify wild-type and polymorphic

16S/23SrRNA spacer region of Pseudomonas putida (see AA169774). The method can be used to detect Pseudomonas bacteria. The present sequence is a PCR primer which was used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ribosomal RNA gene; rRNA gene; internal transcribed spacer; ITS; pathogenic; non-pathogenic; citrus blackspot disease; citrus fruit; differentiation; characterisation; detection; PCR primer; ss.

Through its interaction with ARR6, and in conjunction with protein kinase C, cytohesin-2 functions as a critical link between cell surface receptors and the actin cytoskeleton. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with cytohesin-2 expression, such as atherosclerosis, allograft rejection and hyperproliferative disorders,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense compounds modulating expression of human cytchesin-2 useful for diagnosis, prophylaxis and treatment of diseases associated with expression of cytchesin-2, e.g. cancer, atherosclerosis, allograft

A series of objective cocides (AAF86697-AAF86776) were designed to target different regions of the human cytohesin-2 RNA, and were analysed for their effect on cytohesin-2 mRNA levels by quantitative real-time PCR. Cytohesin-2 is a member of a small family of cytosolic adapter proteins which function as quantime nucleotide exchange factors for ADP ribosylation factors (ARF9), small monomeric G-proteins which regulate critical vesicular traffic pathways. Cytohesin-2 (also known as PSCD2, ARNO for ARP
                                                                                                         cytohesin-2; PSCD2; ARNO for ARF nucleotide binding site opener;

The invention relates to oligonucleotide amplification primers and methods for the detection of pathogenic Guignardia citricarpa. Guignardia citricarpa is a fungus which causes citrus blackspot disease, producing progressive black surface lesions on the fruits of most commercial citrus cultivars such as oranges, lemons, limes, and grapefruit. Although this cultivars such as oranges, lemons, limes, and grapefruit. Although this is a cosmetic disease, it causes significant losses to the citrus fruit caffected fruit. However, there is a second, non-pathogenic Guignardia citricarpi, which also infects citrus fruit, but which forms insignificant leak-ons. This non-pathogenic Guignardia species is morphologically almost indistinguishable from the pathogenic Guignardia citricarpa, and both species may be simultaneously present on transcribed spacer (ITS) regions of the ribosomal RNA gene of either the cannot comparate citricarpa (see AAH73768). These regions exhibit significant difficultiant completes may be distinguished from one other. The present sequence two species may be distinguished from one other. The present sequence trepresents a forward PCR primer specific for the rRNA gene ITS region of the non-pathogenic Guignardia citricarpa (see AAH73768). These regions exhibit significant the presents a forward PCR primer specific for the rRNA gene ITS region of the non-pathogenic Guignardia citricarpi. (Updated on 06-AUG-2003 to
                                                                                                                                                                                                                                                                                                                                                                 New differentiating oligonucleotides which hybridizes with a target DNA sequence associated with pathogenic or non-pathogenic species of Guignardia, for differentiating pathogenic from non-pathogenic species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0.8%; Score 14.2; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to oligonuclectide amplification primers and methods for the detection of pathogenic Guignardia citricarpa is a fungua which causes citrus blackspot disease. Producing progressive black surface lesions on the fruits of most commercial citrus progressive black surface lesions on the fruits of most commercial citrus cultivars such as oranges, lemons, limes, and grapefruit. Although this coultivars such as oranges, lemons, limes, and grapefruit. Although this coultivars is a cosmetic disease; it causes significant losses to the citrus fruit growing industry, as many countries do not permit the importation of affected fruit. However, there is a second, non-pathogenic Guignardia countricant indistinguishable from the pathogenic Guignardia species which forms insignificant lesions. This non-pathogenic Guignardia species con fruit. The primers of the invention are targetted to the internal cone fruit. The primers of the invention are targetted to the internal cone fruit. The primers of the invention are targetted to the internal cone fruit and citricarpa, and both species may be simultaneously present on transcribed spacer (ITS) regions of the ribosomal RNA gene of either the differences between the two species, and provides a means by which the two species, and provides a means by which the represents a reverse PCR primer which can be used to amplify the rRNA gene ITS regions of both the pathogenic Guignardia citricarpa and the non-pathogenic Os pathogenic Guignardia citricarpi. The invention relates to a compound 8-50 nucleobases in length targeted to a nucleic acid molecule encoding caspase 2, which specifically hybridises with and inhibits the expression of caspase 2, or specifically thybridises with and inhibits the expression of caspase 2, or specifically hybridises with an least an 8-nucleobase portion of an active site on a nucleic acid molecule encoding caspase 2. The activity of antisense of oligonucleotides of the livention may be described as, cytostatic, osteopathic, cerebroprotective, neuroprotective, antilipemic, antiinflammatory and antimicrobial. The antisense compounds are useful for tracting an animal having a disease or condition associated with caspase 2, such as haematopoietic disorder, bone metabolism disorder, cholesterol disorder, or a hyperproliferative disorder. These compounds of useful as research reagents and diagnostics, to distinguish the between functions of various members of a biological pathway, in the treatment of a disease or disorder which can be treated by modulating the expression of caspase 2, including cancer, blood disorders, stroke, brain injury and neurodegenerative diseases. They may also be used for thouse of caspase 2, including cancer, blood disorders, stroke, brain continuous and continuous and continuous continuous and continuous cont
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense gene therapy; RAIDD; death domain; caspase recruitment domain; CARD; hyperproliferative disorder; cancer; growth disorder; mouse; metabolic disorder; infection; inflammation; tumour formation; RIP associated ICH-1/CED-3-homologous protein with death domain; receptor interacting protein; antisense oligonucleotide; ss.
                                                     New antisense compounds targeted to nucleic acid molecule encoding caspase 2, useful for treating diseases or conditions associated wicaspase 2, e.g. cancer, blood disorders, stroke, brain injury and neurodegenerative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0.8%; Score 14.2; DB 1; Length 20; 14.2%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                          The invention relates to a DNA marker for detecting Phytophthora infestans in potato and tomato, useful for specifically detecting a small amount of Phytophthora infestans DNA and diagnoshing the infection of Phytophthora infestans in potato and tomato at any time. The DNA marker for Phytophthora infestans in potato and tomato is produced by extracting for Phytophthora species, amplifying the internal transcribed spacer (ITS) II region using primers ITS3 (ABN85669) and ITS4 (ABN85669), cloning the amplified products into pGEM-T easy vector, preparing a primer PISP-1 (ABN85670) and linking the primers PISP-1 and ITS3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                wings consisting 2'methoxyethyl (2'-WOE) nucleotides, 15 are 2'deoxynucleotides, backbone linkages are phosphodiester, all cytosines are 5-methylcytidines"
